Dear Daryn

Thank you for inviting me to observe the **Smart Move Products Ezi drum moving system**. I observed you move large plastic and metal drums with significant ease compared to conventional methods of moving such products i.e. manually rolling drums on their edge.

Your product design will contribute to lowering the potential injury risk associated with the task of moving heavy drums.

You have designed a beautifully balanced product to allow the drums to be moved easily, using an upright body position.

You have designed a product that allows drums to be moved much more easily to/from pallets, reducing the difficulty associated with this aspect of moving drums.

You have designed a product which significantly reduces the manual handling demands. The most demanding component of the task occurs when an operator is pushing the moving system in place.

I envisage that this product has the potential to improve health and safety for employees across a number of industry settings.

I wish you all the best with your product development and future ventures.

Yours sincerely

Jane Lyall
